

PAKET LENGKAP DEVELOPMENT

Marketplace Pakaian Muslim & Produk Fashion — Blueprint + Panduan Antigravity CLI

Stack: Laravel + PHP + MySQL/MariaDB + Blade + Livewire + Alpine.js + Tailwind CSS. Arsitektur server-rendered, modular, ringan, responsif, SEO-friendly, PWA-ready, dan mudah dideploy.

1. Visi Produk

- Bangun satu toko online utama dengan tiga kelas pengguna: Customer/Guest, Member, dan Reseller. Jangan membuat multi-vendor pada MVP.
- Fokus bisnis: penjualan langsung, harga khusus member/reseller, referral/affiliate, komisi, loyalty, dan repeat purchase.

2. Modul Utama

- Storefront: Home, kategori, pencarian, filter, produk, varian, wishlist, cart, checkout, pembayaran, pengiriman, tracking, review.
- Member: dashboard, profil, alamat, pesanan, wishlist, voucher, poin, notifikasi.
- Reseller: pendaftaran, approval, dashboard, katalog, harga reseller, referral link, komisi, wallet, withdrawal, materi promosi.
- Admin: dashboard, produk, kategori, brand, inventory, order, payment, shipping, customer/member, reseller, commission, voucher, promotion, CMS, report, settings, activity log.

3. Database Inti

- users, roles, permissions, role_user, permission_role, profiles, addresses.
- categories, brands, products, product_variants, product_images, product_prices.
- inventories, inventory_movements, carts, cart_items, wishlists, wishlist_items.
- orders, order_items, order_addresses, order_shipments, payments, payment_transactions.
- coupons, coupon_usages, promotions, reviews, review_images.
- reseller_profiles, reseller_links, reseller_commissions, reseller_wallets, reseller_withdrawals.
- points, point_transactions, notifications, banners, pages, blogs, settings, activity_logs.

4. Aturan Database

- Gunakan foreign key, unique constraint, index untuk slug/SKU/status/tanggal/foreign key yang sering difilter.
- Gunakan decimal untuk uang, integer untuk stok, UUID/ULID bila dipilih konsisten sejak awal. Jangan menyimpan saldo hanya sebagai angka tanpa ledger transaksi.
- Inventory harus memiliki movement history: opening, purchase/restock, sale, return, adjustment.
- Commission memiliki lifecycle PENDING → AVAILABLE setelah order completed → PAID saat withdrawal selesai; order refund/cancel harus membalikkan komisi sesuai aturan bisnis.

5. User Flow

- Guest: Home → Search/Category → Product → Variant → Cart → Checkout → Guest/Login → Address → Shipping → Payment → Order Success → Tracking.
- Member: Register → Verify → Browse → Wishlist/Cart → Checkout → Order → Review → Poin/Voucher → Repeat Purchase.

• Reseller: Member → Apply → Admin Review → Approved → Reseller Price/Referral → Customer Order → Order Completed → Commission Available → Withdrawal → Paid.

6. UI/UX

- Mobile-first pada 360/390/430 px lalu tablet dan desktop. Gunakan desain clean, premium, modern, trustworthy; ornamen Islami secukupnya.
- Header: logo, search, wishlist, cart, account. Homepage: hero, kategori, flash sale, best seller, new arrival, member promo, reseller program, recommendation, testimonial, blog.
- Product card sederhana: image, wishlist, name, rating, price, sold. Checkout mobile memakai sticky total + tombol bayar.
- Gunakan design tokens untuk warna, spacing, typography, radius, shadow, breakpoint; jangan hard-code gaya di setiap komponen.

7. Performance

- Server-side rendering sebagai default; Livewire hanya untuk interaksi yang memang membutuhkan state.
- Optimalkan gambar: resize, WebP/AVIF, thumbnail, lazy loading. Hindari gambar multi-MB.
- Gunakan eager loading yang tepat, pagination, database indexes, cache untuk kategori/settings/homepage/popular products.
- Jangan cache data real-time seperti stok, payment, order status, dan wallet secara sembarangan.
- Gunakan queue untuk email, notifikasi, image processing, dan pekerjaan berat. Hindari query N+1.

8. Security

- CSRF, XSS-safe output, validation, authorization/policies, rate limiting, secure upload, password hashing, email verification, session security, webhook verification, audit log.
- Admin: gunakan 2FA bila tersedia. Reseller tidak boleh mengakses data reseller lain.
- Jangan percaya harga, diskon, komisi, stok, shipping cost, atau role dari request browser; hitung ulang di server.

9. SEO & Marketing

- Slug produk/kategori, SEO title, meta description, canonical, OG image, Product structured data, sitemap, robots, semantic HTML.
- Marketing engine: voucher, promo, flash sale, free shipping, member discount, reseller discount, campaign, referral, loyalty, blog.
- Funnel: Visitor → View Product → Add Cart → Checkout → Purchase → Review → Repeat Purchase → Become Reseller.

10. Deployment

- Target utama: Linux VPS + Nginx + PHP-FPM + MySQL/MariaDB + SSL. Tetap kompatibel dengan shared hosting sejauh fitur server tersedia.
- Gunakan .env, APP_KEY, storage link, migration, queue worker/scheduler, cron, backup database, log rotation, HTTPS.
- Production checklist: APP_ENV=production, APP_DEBUG=false, cache config/routes/views, optimize autoload, permission storage/bootstrap/cache, queue, scheduler, backup, monitoring.

11. Roadmap

- Phase 0: requirement, architecture, coding rules, environment.

- Phase 1: Laravel foundation, auth, roles/permissions, layout, theme, security.
- Phase 2: category, brand, product, variants, images, pricing, inventory.
- Phase 3: storefront, search, filter, wishlist, cart.
- Phase 4: address, shipping, payment, order, invoice/tracking.
- Phase 5: member dashboard, voucher, points, notification, review.
- Phase 6: reseller registration, approval, pricing, referral, commission, wallet, withdrawal.
- Phase 7: admin dashboard, CMS, promotion, reports.
- Phase 8: SEO, PWA, marketing.
- Phase 9: testing, security audit, performance optimization.
- Phase 10: production deployment and monitoring.

12. Acceptance Criteria Global

- Semua fitur memiliki validation, authorization, loading/empty/error states, responsive UI, test minimal untuk business-critical flow.
- Tidak ada broken link/route, N+1 query, error JS console yang tidak ditangani, akses role yang bocor, atau transaksi keuangan tanpa audit trail.
- Mobile usability, checkout, payment callback, stock consistency, reseller commission, withdrawal, dan refund/cancel harus diuji sebelum production.

PROMPT MASTER ANTIGRAVITY CLI

Anda adalah Senior Laravel Architect, Senior Full-Stack Engineer, UI/UX Engineer, QA Engineer, Security Engineer, dan DevOps Engineer.

Bangun aplikasi Marketplace Pakaian Muslim berdasarkan spesifikasi proyek yang diberikan di repository. Stack wajib: Laravel + PHP + MySQL/MariaDB + Blade + Livewire + Alpine.js + Tailwind CSS. Prioritaskan server-side rendering, ringan, cepat, responsive, SEO-friendly, PWA-ready, dan mudah deploy.

ATURAN KERJA:

1. Jangan mengubah stack tanpa alasan teknis yang kuat dan persetujuan.
2. Jangan membangun multi-vendor pada MVP.
3. Jangan menghapus fitur/kode yang sudah bekerja.
4. Sebelum coding, inspeksi repository, composer.json, package.json, .env.example, routes, migrations, models, tests, dan struktur UI yang sudah ada.
5. Implementasikan satu phase pada satu waktu sesuai TASK yang diberikan.
6. Jangan membuat giant controller/component. Gunakan Actions/Services/Policies/Enums/Form Requests sesuai kebutuhan.
7. Semua business-critical operation harus divalidasi server-side.
8. Uang menggunakan decimal; stok dan saldo harus memiliki audit/ledger yang dapat ditelusuri.
9. Jangan mempercayai price, discount, commission, stock, shipping, atau role dari client.
10. Gunakan eager loading dan indexes untuk mencegah N+1 dan query lambat.
11. Gambar harus dioptimalkan dan lazy-loaded.
12. UI wajib mobile-first dan memiliki loading, empty, error, success state.
13. Setelah implementasi, jalankan migration/test/lint/build yang relevan dan perbaiki error sebelum menyatakan phase selesai.
14. Jangan lanjut ke phase berikutnya jika acceptance criteria phase aktif belum terpenuhi.

OUTPUT SETIAP PHASE:

- Ringkasan perubahan
- File yang dibuat/diubah
- Migration/model/route penting
- Test yang dibuat/dijalankan
- Error yang ditemukan dan perbaikannya
- Acceptance criteria checklist
- Risiko/technical debt
- Perintah berikutnya yang direkomendasikan

Mulai dengan membaca repository dan membuat laporan audit singkat. Jangan melakukan perubahan besar sebelum audit selesai.

PROMPT PER PHASE

PHASE 0 — AUDIT & FOUNDATION

Audit repository. Pastikan Laravel, PHP, database, frontend build, auth, environment, dan dependency konsisten. Buat ARCHITECTURE.md dan DEVELOPMENT_RULES.md. Jangan membangun fitur bisnis sebelum audit selesai.

PHASE 1 — AUTH & RBAC

Bangun authentication, profile, role/permission, policies, admin/member/reseller route guards, layout dasar, responsive navigation, design tokens, dan security baseline. Tambahkan tests authorization.

PHASE 2 — PRODUCT & INVENTORY

Bangun categories, brands, products, variants, images, product prices berdasarkan tipe customer, inventory dan inventory movements. Tambahkan CRUD admin, validation, authorization, indexes, seeders, dan tests.

PHASE 3 — STOREFRONT

Bangun homepage, catalog, category, search, filter, sorting, product detail, wishlist, cart. Optimalkan query, pagination, image loading, SEO metadata, responsive UI.

PHASE 4 — CHECKOUT & ORDER

Bangun address, cart validation, shipping service abstraction, payment gateway abstraction, order lifecycle, payment transaction, invoice, tracking. Pastikan idempotency webhook dan stock consistency.

PHASE 5 — MEMBER

Bangun dashboard member, order history/detail, address management, wishlist, voucher, points ledger, notifications, review. Tambahkan tests.

PHASE 6 — RESELLER

Bangun reseller application/approval, reseller pricing, referral links, attribution, commission ledger, wallet, withdrawal, admin approval, marketing materials. Commission hanya available setelah order completed dan aturan refund/cancel diterapkan.

PHASE 7 — ADMIN & CMS

Bangun admin dashboard, order management, customer/member/reseller management, inventory, promo, voucher, commission, withdrawal, CMS banner/pages/blog, reports, settings, activity logs.

PHASE 8 — SEO/PWA/MARKETING

Implementasikan sitemap, robots, structured data, canonical, OG, PWA manifest/service worker yang ringan, campaign, flash sale, referral/loyalty presentation, analytics hooks.

PHASE 9 — QA SECURITY PERFORMANCE

Lakukan feature test, authorization test, order/payment/reseller tests, security audit, query audit, N+1 detection, image/performance optimization, responsive QA, accessibility baseline. Perbaiki semua blocker.

PHASE 10 — PRODUCTION

Siapkan production env example, deployment documentation, migrations/seed strategy, storage, queue worker, scheduler, cron, SSL, backup, cache, logs, health check, rollback procedure, dan final smoke test.

PROMPT DEBUGGING

Anda bertindak sebagai Senior Debugging Engineer. Periksa error berdasarkan stack trace/log/test failure yang tersedia. Jangan menebak. Identifikasi root cause, file dan line terkait, dependency/configuration yang relevan, lalu lakukan perubahan paling kecil yang aman. Jangan menghapus test untuk membuat test pass. Setelah perbaikan, jalankan ulang test/command yang gagal dan regression test terkait. Laporkan root cause, file berubah, test sebelum/sesudah, dan risiko.

PROMPT TESTING

Lakukan QA menyeluruh pada aplikasi. Prioritaskan authentication/RBAC, product variant, stock, cart, checkout, payment webhook/idempotency, order lifecycle, refund/cancel, reseller attribution, commission, wallet, withdrawal, voucher, dan admin authorization. Buat Feature/Unit tests untuk business-critical flow. Jangan mock terlalu banyak sampai test kehilangan makna. Jalankan seluruh test suite dan laporkan failure serta perbaikannya.

PROMPT SECURITY AUDIT

Lakukan security audit aplikasi Laravel. Periksa authentication, authorization/IDOR, mass assignment, validation, XSS, CSRF, SQL injection, file upload, rate limiting, session/cookie, secrets, webhook signature, privilege escalation, reseller data isolation, financial calculation tampering, logging, dan production configuration. Buat temuan berdasarkan severity Critical/High/Medium/Low. Perbaiki Critical/High dan tambahkan regression tests.

PROMPT PERFORMANCE

Lakukan performance audit. Cari N+1, query berulang, missing indexes, oversized payload, image bottleneck, unnecessary Livewire requests, excessive JavaScript/CSS, blocking resources, cache opportunity, queue opportunity, dan slow admin/report queries. Optimalkan tanpa mengubah behavior bisnis. Verifikasi dengan query inspection dan build/test yang relevan.

PROMPT DEPLOYMENT

Siapkan deployment production Laravel untuk Linux VPS + Nginx + PHP-FPM + MySQL/MariaDB. Buat dokumentasi langkah demi langkah: server prerequisites, environment, database, migrations, storage link, permissions, SSL, queue worker, scheduler/cron, cache optimization, backups, logs, health check, restart/rollback. Pastikan APP_DEBUG=false dan secrets tidak masuk repository. Sertakan checklist smoke test setelah deployment.
